Editor's Choice 10 Photoshop
Features You Didn't Know
Existed You probably already
know why you would use
Photoshop in the first place.

But, did you know that Photoshop supports quite a lot of tools and features that you probably didn't even know existed? These extra tools and features might be useful for different types of images, but they can also be a fun way to make new images or even for designing web pages and logos. It's all just a matter of

knowing which Photoshop features to use. The following are some cool features in Photoshop that you may not know exist. Image Editing & Decoration Colored Backgrounds and Gradients Hyperlocal Blending Animating Brushes Using the Power of Movement & Animation Image Overlays

Background For your next themed photoshoot, it's often important to think about creating the overall background of the image. One way to make a unique background is to use the Effect > Exclude > Darken option. This simply blends the shadow over a color that's already on the canvas, like the

background color. An alternative to this is to use the Background Pixelate filter to blur all the background colors over an RGB image. This can create a unique look and makes it easier for you to pick up the colors that you want for the rest of the image. You can also use this technique to make solid colors more

powerful by blurring all the backgrounds. You can use a simple Dodge and Burn filter to add this effect to a bright background. You can also do a similar effect using the Border Blur filter and by setting the blending mode to Screen. The same idea can be done with `bl 05a79cecff`

Q: Add Php Imap Class to Customer Attributes I'm using the following library with Email Updater for Magento: I need to extend the functionality of this library and add an attribute called 'custom_attributes' to the customer model which

contains an array of added custom attributes. I don't know how to add this to the library above as it is a Composer package. Anyone know how to make this work? A: I was able to figure out this on my own. I followed this answer to the same question: And then added the following code to the customer model in the

```
CustomerInterface file: public
function addAttributeToCollection($attrCode, $fieldset =
null) { $attrCode =
strtoupper($attrCode);
switch($attrCode) { case
'billing_name': $fieldset =
$this->getAttribute('name');
break; case 'billing_street':
$fieldset =
$this->getAttribute('address');
```

```
break; case 'billing_city':  
$fieldset =  
$this->getAttribute('city');  
break; case 'billing_telephone':  
$fieldset = $this->getAttribute  
(  
'telephone'); break; case  
'billing_country_id': $fieldset  
= $this->getAttribute('country  
_id');
```

1. Field of the Invention The present invention relates to a method for measuring the concentration of a specific component in a material, such as water or blood. 2.

Description of the Prior Art
Methods for the measurement of the concentration of sodium chloride in water are well

known. The measurement of the concentration of other components, e.g., potassium, magnesium and calcium, in water is also well known. A variety of methods can be utilized to accomplish the measurement of the concentration of a specific component in water. See, for example, U.S. Pat. Nos.

known methods for the
measurement of the
concentration of a component

in a material, such as water, are primarily based upon the use of ion-sensitive electrodes and membrane material. A reference electrode is normally used to maintain the electrochemical system in an electrochemical equilibrium. Certain types of electrode materials may interfere with the determination of the

concentration of the electrolyte by virtue of an anomalous potential or by the alteration of the potential of the solution, depending upon the type of ion-sensitive material used. For example, some ion-sensitive material is not affected by chloride ions, and will alter the potential of the reference electrode by a

small amount, thereby interfering with the measurement of the chloride ion concentration. Some ion-sensitive material is highly specific for an ion which is not necessarily present in the solution in a high concentration, but which is nevertheless present in the solution at a concentration

lower than the specific ion to be measured. This may be the situation when the high concentration of the material to be measured is present as the material in solution or in the ionic complex. The high concentration of the material may be present in the gas phase, in the gel or sol state, or in solutions for biological or

industrial use. The concentration of this material in the solution to be measured is generally not high enough to be accurately measured by available electrodes. Ion-sensitive material is also used to measure components of low concentration in material which may have other constituents of either similar

or dissimilar valence, or which
may be in a non-solid
